72-75 :

Read the passage below and answer the questions that follow based on your understanding of the passage.

The minimal distinctive unit of grammar, and the central concern of Morphology is the morpheme. Its original motivation was as an alternative to the notion of the word, which had proved to be difficult to work within comparing languages. Words, moreover, could be quite complex in structure, and there was a need for a single concept to interrelate such notions as

Root, Prefix, Compound, etc. The morpheme, accordingly was seen primarily as the smallest functioning unit in the composition of words.

Morphemes are commonly classified into free forms and bound forms; thus unselfish consists of the three morphemes un, self, and ish, of which 'self' is a free form, unand -ish are bound forms. A word consisting of a single (free) morpheme is a monomorphemic word : its opposite is polymorphemic. A further distinction may between and be made lexical "grammatical morphemes", the former are morphemes used for the construction of new words in a language, such as in compound words (e.g. blackbird), and affixes such as -ship, -ise; the latter are morphemes used to express grammatical relationships between a word and its context, such as plurality or past tense. Grammatical morphemes which are separate words are called function words.

- **72.** The forms which are more complex and difficult to work with are
 - (A) Morph
